"Esc (with the 'ape' pre-removed)."¹

QWERTY opens with a shriek. The ESCape key, serving as entry to the keyboard, signifies escape from neoroman alphanumeric, and entry into the CRYPT (AQ-127 = QWYZ = NUMBER) of qwercultures. In Anglossic Qabbala², ESC = AQ-54 (= AOK³ = KEK⁴⁵ = RED = NAL⁶; or, reversed, AQ-45 = AZ (the final qryz of part one) = LO (a call, and the first message sent over the budding internet⁷)), invoking the great lemur Khattak, both in its equivalencies and as a reference to her netspan (5::4). The keyboard further closes with ENTER (AQ-109 = ENDING), reflecting the cyclical capture of time and culture by QWERTY (AQ-162 = RAPTURE).

Much has been made of the QWERTY keyboard as a model of path-dependency⁸⁹; it has been examined from the perspective of stratoanalysis and semiotics¹⁰, but the qabbalistic analysis of Qwertian has never been fully explored.¹¹¹²¹³ The *Liber Qwyz* is a dictionary of Alpha-Qwertian words, each signified by a number (0-2256), constructed by the relations between Qwertian and neoroman alphabets.

In lieu of a full analysis of the potential usages of the *Liber Qwyz*, this commentary will simply introduce the *Qwyz*, concisely explain the methodology of its construction, and seek to answer some potential questions.

The *Qwyz* is constructed from the crossover between the neoroman and Qwertian dictionaries, each themselves constructed as follows. Each word is defined as a non-repeating sequence of letters, in alphabetical order. Using the neoroman alphabet as an example: A combines with B, C... Z, B combines with C, D... Z, etc. Thus, AE is a valid neoroman word, but not EA (due to ordering); AEA is not

11 'Introduction to Qwernomics' introduces the *Liber Qwyz* in its latter half, and an early rendition (including single letters) of its first part is in the comment section. Much of the explanation of the methodology of its excavation here is simply an unpacking of this essay into plain English.

13 A "complete" Alpha-Qwertian dictionary exists at <https://timespiralpress.net/2016/06/21/alpha-qwertian/>, but is missing several values and contains several errors. To our knowledge, the following dictionary is complete and correct, stylistic quibbles aside – computation has left no room for human error. No Qwertian ordering has previously surfaced.

valid (due to multiple occurrences of the same letter). The entire vocabulary of a 26-character alphabet is thus $(2^{26})-1$ (a Mersenne number).

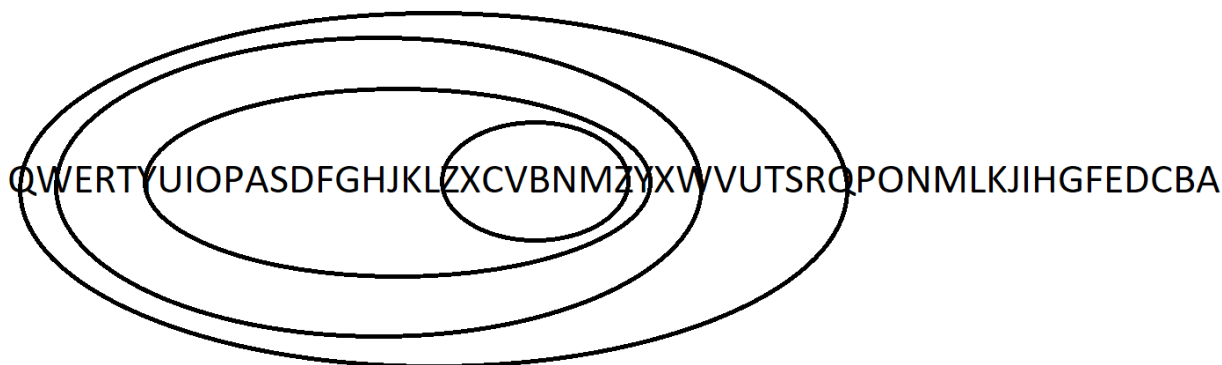

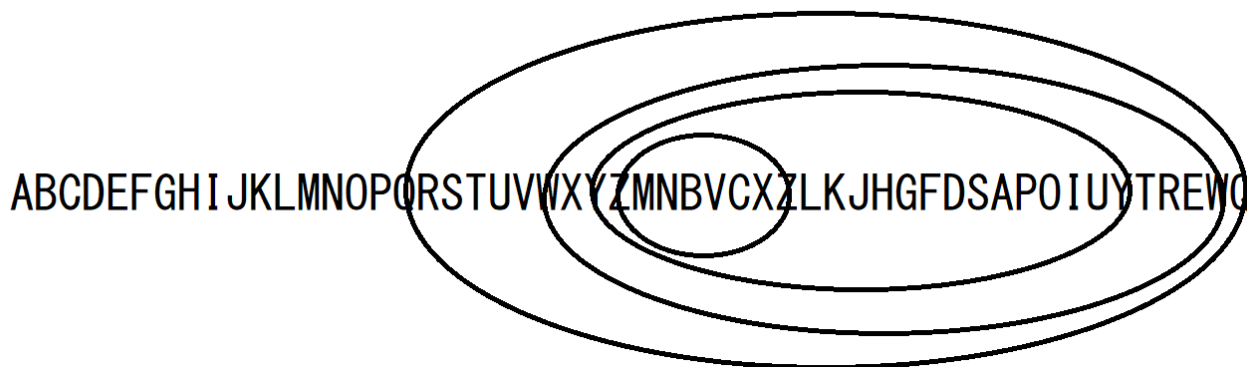

Neoroman textual organization (left to right, top to bottom) as applied to the keyboard allows for the construction of a Qwertian alphabet:

QWERTYUIOPASDFGHJKLZXCVBNM

Applying the same principles to the Qwertian alphabet constructs a parallel vocabulary, with some crossover. That crossover constitutes the qryz (words) of the *Liber Qwyz*. This can be more easily constructed graphically, drawing arcs between the repetitions of the letters in the following sequence (or its reversed form):

ABCDEFGHIJKLMNOPQRSTUVWXYZMNBVCXZLKJHGFDSAPOIUYTREWQ

Letters within the bounds of the arcs of (a) given previous letter(s) are valid as a word in both sets, as illustrated by the following example (for the word 'QWYZ'):

The *Qwyz* can be presented in either neoroman or qwertian order; the contents of each are the same. Each word corresponds to another of the same number within the alternate ordering - for example "qwyz" is Oecumenic-2208 & Qwertian-2. The qabbalistic analysis of these numbers, and their relations to the qryz, is an

object for future inquiry. In the first version of the *Qwyz*, single letters were included, but they have since been redacted. The justification for this is uncharacteristically clear, and is thus reproduced in full: "as the D&Gons say (from memory so might not be exactly right) 'subtract the unique from the multiplicity to be constituted' - single letters should be expunged from the dictionary, because they have not undergone any relevant sel[e]ction process, and thus impose themselves as dogmatic presuppositions of the complete system"¹⁴.

Certain sections of the alphabets lend themselves to prominence within the *Qwyz*. Notably, much of the bottom row of the keyboard (as the final section of the Qwertian alphabet) corresponds heavily to the end of the neoroman alphabet, providing a section of intensity at the intersection of the two alphabets - resulting in their frequent occurrence at the ends of many *qryz*. A further section of intensity is in the middle row of the keyboard, with the section DFGHJKL corresponding precisely (with the exception of vowels) to the order of the neoroman alphabet. The frequent re-occurrence of parts of this sequence throughout the *Qwyz* is due to this correspondence - most progressions of letters within a sequence render large chunks of the alphabet useless in further construction of a *qryz*, while this linear progression removes no letters bar themselves from validity. Other sections and letters of intensity stem primarily through early placement in both sequences (such as E).

The question of pronunciation of the *qryz* opens an interesting avenue for discussion - the radically dehumanizing nature of *qwer*cultures. *Qwyzical* wordplay aside, much of the *Qwyz* is radically alien to human speech patterns. QWERTY has, since its inception, been a process of radically machinic reworking of the (primarily female¹⁵) human subconscious - attempts to revert this, and approach *qwer*culture from the perspective of the human, are by nature futile.

The usage of the *Liber Qwyz* remains unclear. It has been suggested (partially by virtue of the significance of the final number of part 1 - 777) that the *qryz* are demons, or perhaps this is simply all that can be tentatively grasped of the dialect of a future *qwer*culture.

If QWERTY is the "capitalist revelation"¹⁶ par excellence, and "a key to the nature of modernistic time", perhaps the *qryz*, as a relation between *qwer*cultures and Oecumenic ones, open the door to understanding its relation to ourselves.
